Method 2. To reduce a fraction to lowest terms (also called its simplest form), just divide both the numerator and denominator by the Greatest Common Factor (GCF or GCD). For example, 2/3 is in lowest form, but 4/6 is not in lowest form (the GCD of 4 and 6 is 2) and 4/6 can be expressed as 2/3.

An equation involving x and y, which is also a function, can be written in the form  $y = \text{" some expression involving x "}$ ; that is,  $y = f(x)$ . This last expression is read as " y equals f of x " and means that y is a function of x. This concept also may be thought of as a machine into which inputs are fed and from which outputs are expelled.

The formula for the area of a circle is an example of a polynomial function. The general form for such functions is  $P(x) = a_0 + a_1x + a_2x^2 + \dots + a_nx^n$ , where the coefficients ( $a_0, a_1, a_2, \dots, a_n$ ) are given, x can be any real number, and all the powers of x are counting numbers (1, 2, 3, ...). (When the powers of x can be any real number, the result is known as an algebraic function.)

In this section we will formally define relations and functions. We also give a " working definition " of a function to help understand just what a function is. We introduce function notation and work several examples illustrating how it works. We also define the domain and range of a function. In addition, we introduce piecewise functions in this section.

Users of natural languages have many word orders with which to encode the same truth-conditional meaning. They choose contextually appropriate strings from these many ways with little conscious effort and with effective communicative results. Previous computational models of when English speakers produce non-canonical word orders, like topicalization, left-dislocation and clefts, fail. The primary goal of this book is to present a better model of when speakers choose to produce certain non-canonical word orders by incorporating the effects of discourse context and speaker goals on syntactic choice. This book makes extensive use of previously unexamined naturally occurring corpus data of non-canonical word order in English, both to illustrate the points of the theoretical model and to train the statistical model.
